

2. Literature Review

2.1 Feedback & Evaluation

The proposed Restaurant Finder system addresses a real-world need by providing users with an efficient way to discover and evaluate restaurants based on their preferences. With the increasing reliance on web applications for daily activities, such systems play an important role in improving user convenience and decision-making.

The project demonstrates a clear understanding of core functionalities required in modern web applications, including search, filtering, and detailed information display. The inclusion of features such as restaurant ratings, reviews, and location mapping enhances the usability and practicality of the system.

From a technical perspective, the project reflects good use of front-end development concepts and API integration, which are essential for building dynamic and scalable web applications. However, there is still room for improvement in terms of performance optimization, user interface consistency, and handling edge cases.

Overall, the project shows strong potential but requires further refinement to reach a production-level quality.

2.2 Suggested Improvements

- **UI/UX Enhancement:** Improve visual design and maintain consistency in colors, typography, and spacing.
- **Performance Optimization:** Optimize API calls and reduce loading time.
- **Advanced Search & Filtering:** Add filters such as cuisine, distance, popularity.
- **Authentication System:** Enable login and personalization features.
- **Error Handling & Validation:** Improve handling of failures and invalid inputs.
- **Scalability:** Use modular architecture for future expansion.
- **Responsive Design:** Ensure compatibility across all devices.

2.3 Final Grading Criteria

- **Documentation Quality:** Clarity and organization.
- **System Analysis & Design:** Proper requirements and architecture.
- **Implementation & Code Quality:** Clean and maintainable code.
- **Functionality & Features:** Successful implementation.
- **Testing & Reliability:** Stable performance.
- **User Experience (UX):** Ease of use and navigation.
- **Final Presentation:** Clear explanation and demonstration.
