

System Deployment & Integration

Technology Stack:

- **Frontend:** JavaScript (HTML, CSS)
 - **External API:** Yelp API (for restaurant data)
 - **Database:** Microsoft SQL Server (for user data)
-

Deployment Diagram:

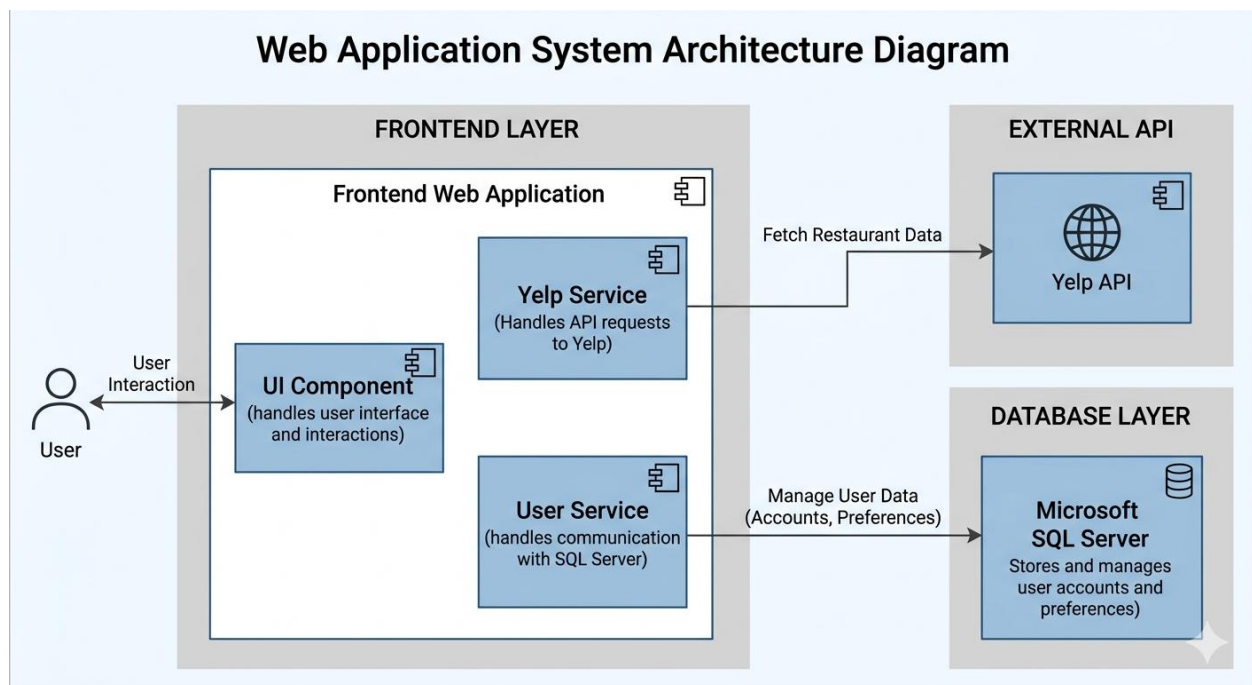

The deployment architecture represents how the system components are physically distributed and interact with each other.

The user accesses the system through a web browser, which runs the frontend application on a local machine. The frontend communicates with the Yelp API over the internet to fetch restaurant data. It also interacts with a Microsoft SQL Server database to store and retrieve user information.

This architecture shows the separation between the client-side application, external services, and the database layer.

Component Diagram:

The component diagram illustrates the internal structure of the frontend application and how different components interact with external systems.

The frontend consists of multiple components:

- **UI Component:** Responsible for displaying the interface and handling user interaction.

- **Yelp Service Component:** Handles communication with the Yelp API to fetch restaurant data.
- **User Service Component:** Manages user-related operations and communicates with the Microsoft SQL Server database.

These components work together to ensure smooth data flow between the user interface, external API, and database.
